TITLE: The Photoconductivity of Single Crystals of Antimony Selenide

PERIODICAL: Uch. zap. Azerb. un-t, Fiz.-matem. i khim. ser., 1959, Nr 1, pp 79-83  
(Azerb. summary)

ABSTRACT: The spectral distribution curve of the inner photoeffect of  $Sb_2Se_3$  single crystals has two maxima: at  $\sim 500 \text{ m}\mu$  and  $\sim 1\mu$ ; the specific sensitivity in the polycrystalline samples investigated varied within the range of 12 - 40  $\mu \text{ a/lumen v.}$  In order to take into account the sharply pronounced anisotropy of single crystals the curves of the spectral distribution of photoconductivity were measured for three mutually perpendicular directions. It has been established that for all three directions, both maxima do not change their positions, but their relative values essentially depend on the direction chosen: the photoconductivity which is measured along the layers has a clearly expressed short-wave maximum and a weak long-wave maximum, whereas in the photoconductivity measured perpendicular to the layers the opposite is true. The integral

Card 1/2

The Photoconductivity of Single Crystals of Antimony Selenide 68951 SOV/81-60-2-3808  
sensitivity of individual samples of  $Sb_2Se_3$  single crystals was  $200 \mu a/lumen v$  at 200 lux. It has been discovered that in the case of substituting Sb by atoms of As and Bi the short-wave maximum shifts to the side of longer wave-lengths, but the position of the long-wave maximum remains unchanged. In the case of substituting Se by S atoms the short-wave maximum remains on its place, but the long-wave maximum shifts to the side of short waves.

SOURCE: AN AzerbSSR. Doklady, v. 21, no. 4, 1965, 22-25

TOPIC TAGS: organic compound, plasticizer, polyester, cyclohexylcarbinol, fatty acid

ABSTRACT: The following esters of cyclohexylcarbinol were synthesized: formic, acetic, propionic, butyric, valeric, capronic, enantic, caprylic, polarganylic and caprynylic. The work is an extension of previously published results by B. K. Zeynalov and R. M. Aliyev (DAN Azerb. SSR. 1964, 5). Physical properties of the synthesized esters, viz: refractive index, molecular weight, boiling point, KOH number, and per cent yield, are tabulated. The esterification of the C<sub>5</sub>-C<sub>6</sub>

and C<sub>7</sub>-C<sub>9</sub> fractions of commercial synthetic fatty acids by cyclohexylcarbinol is described. It was found that the valeryl cyclohexylcarbinol ester when administered in 0.5-ml dosage to rabbits sharply decreases the heart activity and

Oxidation of paraffin distillates and the means of practical use of oxidation products (Okisleniye parafinistogo distillyata i puti prakticheskogo ispol'zovaniya produktov okisleniya) Baku, Azerneshr, 1964. 0255 p. illus., biblio., tables. 1,110 copies printed.

TOPIC TAGS: hydrocarbon oxidation, paraffinic distillate, ester synthesis, carboxylic acid synthesis, oxy acid synthesis, neutral oxy compound, plasticizer technology, Plastiazan 1

PURPOSE AND COVERAGE: This book is meant for scientists, engineers, and technicians employed in the chemical, petroleum, petrochemical, and food industries, who work in research and development involving the oxidation of petroleum hydrocarbons. It may also be useful to specialists who study the potential industrial applications of petroleum oxidation products. The text of this review book is based on Western and Soviet-bloc literature ranging from 1854 to 1963, and on research carried out by the author and his coworkers. The author discussed processes of liquid-phase oxidation of a paraffinic distillate with oxygen from air. The purpose of this oxidation is the commercial production of carboxylic and hydroxy

Card 1/3

2  
acids, and oxygen-containing neutral compounds. The industrial processes used for the manufacture of these compounds are described. Recommendations are made for the processing and use of products obtained from the oxidation of paraffinic distillates. These products were used as irrital materials for the preparation of high-quality plasticizers for polymers, and as reagents in the chemical treatment of drilling fluids. Procedure has been developed for: 1) the production of monocarboxylic acids by the oxidation of the paraffin fraction separated from the paraffinic distillate during carbamide dewaxing; 2) the preparation of commercial carboxylic, hydroxy, and other acids by oxidizing, the raw distillate or deano-  
matized and dewaxed distillate.

TITLE: Synthesis of vinyl esters from commercial fractions of  
C<sub>5</sub> - C<sub>6</sub> fatty acids and acetylene

SOURCE: AN AzerbSSR. Doklady\*, v. 19, no. 12, 1963, 15-17

TOPIC TAGS: vinyl ester, C<sub>5</sub> fatty acid, C<sub>6</sub> fatty acid, activated  
carbon

ABSTRACT: The purpose of the present investigation was to find an industrial application for the fatty acids of the C<sub>5</sub> - C<sub>6</sub> fraction obtained by direct oxidation of the paraffin hydrocarbons. A commercial fraction of fatty acids (boiling point of 180—200C) was reacted with acetylene, using activated AG carbon impregnated with salts of the same acids as catalyst. The equipment consisted of a reactor, a coil vaporizer, and five condensers, two of which were cooled with dry ice. The experiments were carried out at a acetylene:acid ratio of 9:1. The temperature of the catalyst was 245—250C, the temperature in the coil vaporizer for fatty acids was 220—225C, the rate  
Card 1/2

ACCESSION NR: AP4022010

of fatty acid feed was 30 cm<sup>3</sup>/hour, and the acetylene rate was 3.3—3.5 liter/min. The acetylene was mixed with the vapors of fatty acids before entering the reaction chamber. An 81% yield of the catalyzate was obtained, with the noncondensed vapors being discharged into the atmosphere. Five fractions were isolated from the catalyzate within a boiling range of 85—180C (75.9% were vinyl esters, the bromine number of which ranged from 125.7 to 84.44). The 135—155C fraction was the largest, representing a 31.3% yield on the basis of the fatty acids used in the reaction. It had a molecular weight of 131.4 and a bromine number of 112.3, as against a theoretical bromine number of 118.4 for vinyl ester. Orig. art. has: 1 table.

TITLE: Investigation in the Field of Glycol Ethers and Their Derivatives (Issledovaniye v oblasti prostykh efirov glikoley i ikh proizvodnykh) XXXIII. On Some Chemical Conversions of the  $\gamma$ -Ethyl Bromides of the Fatty Series (XXXIII. O nekotorykh khimicheskikh prevrashcheniyakh prostykh  $\gamma$ -bromefirov zhirnogo ryada)

PERIODICAL: Zhurnal obshchey khimii, 1958, Vol 28, Nr 7, pp 1831 - 1834 (USSR)

ABSTRACT: Continuing an earlier paper (Ref 1) the authors carried out some little-known conversions of  $\gamma$ -ethyl bromide. The hydrolysis experiments of these ethers carried out in the presence of  $\text{Na}_2\text{CO}_3$  and  $\text{CaCO}_3$  (10-12 hours) showed that on this occasion HBr is split off under the formation of ethers of the homologs of allyl-alcohol (II). In all these cases none of the incomplete  $\gamma$ -glycol ethers to be expected, but only unsaturated ethers resulted. In the case of heating the  $\gamma$ -ethyl bromides (I) with alcoholate the HBr cleavage takes only 2-3 hours and no etherification but a formation of allyl ethers (II) takes place which corresponds to the Markovnikov rule (Ref 1). The  $\gamma$ -ethyl bromides easily

Card 1/3

Investigation in the Field of Glycol Ethers and Their Derivatives. XXXIII. On Some Chemical Conversions of the  $\gamma$ -Ethyl Bromides of the Fatty Series SOV/79-28-7-22/64

yield organomagnesium compounds (III), which form 1,4-glycol-ether (IV) with  $\alpha$ -chloric ether. This reaction process (see reaction scheme) points to the possibility of a new synthesis of glycol ether with various alkoxy groups in the positions 1,4(IV). 1,3-dihalogen derivatives (V) form on the action of HBr or HJ on the  $\gamma$ -ethyl bromide. This way six new 1,3-dihalogen derivatives of fatty hydrocarbons were synthesized (Table). All above mentioned conversions make possible the production of further compounds on the same basis. There are 1 table and 5 references, 4 of which are Soviet.

TEXT: The authors describe an automatic unit for zonal melting and equalization of the composition of semiconductor materials with a resistance heater. The unit is equipped with a device registering the number of passes. Zonal melting can be conducted both in a vacuum and inert gas atmosphere. Results of zonal refining of Sb selenide are given. At a motion speed of the zone as high as 0.5 mm/hour, single crystals of Sb selenide of up to 20 - 25 mm length are obtained. The admixtures of Fe, Cu, As, Al, Bi revealed, show a distribution factor below one.

TOPIC TAGS: plasticizer, ester, fatty acid

ABSTRACT: The synthesis of 2-methylcyclohexyl esters (plasticizers) of C<sub>1</sub>-C<sub>10</sub> fatty acids (formic, acetic, propionic, n-butyric, n-valeric, n-caproic, n-enanthic, n-caprylic, n-pelargonic, and n-capric acids) and commercial fractions of C<sub>5</sub>-C<sub>6</sub> and C<sub>7</sub>-C<sub>9</sub> fatty acids was studied. The reaction is as follows:

Card 1/2

L 22687-66

ACC NR: AP6006934

The optimum conditions were: ratio of 2-methylcyclohexanol (MCH) to fatty acid, 0.8:1 (moles); time, 4 hr; temperature, 130°C; catalyst, 96% H<sub>2</sub>SO<sub>4</sub> (4% of weight of MCH); azeotrope-forming substance, toluene (2.8 times the amount of MCH). The yield of esters was 60-70% based on MCH. In all the experiments, the esterification reaction was continued until equilibrium was established, as indicated by the constant value of the acid number. The esters obtained were colorless liquids insoluble in water but soluble in alcohol, ethyl ether, benzene, acetone. Their physicochemical characteristics are tabulated. Orig. art. has: 1 table.

ORG: INKhP AN AzerbSSR

TITLE: Synthesis of esters (plasticizers) from synthetic acids. Synthesis of plasticizers from a mixture of fatty and naphthonic acids and diethyl sulfate

SOURCE: Azerbaydzhanskiy khimicheskiy zhurnal, no. 1, 1966, 47-51

TOPIC TAGS: plasticizer, fatty acid, sulfate, ester

ABSTRACT: Ester plasticizers were synthesized from fatty and naphthonic acids and diethyl sulfate (DES) on a laboratory metal unit and on pilot units in three stages: (1) preparation of alkali salts of synthetic acids by the action of alkalis; (2) synthesis of ethyl esters by the action of DES on the salts; (3) treatment of the reaction mixture for the purpose of isolating the target product. The influence of time, temperature, reaction medium, and solution of DES in CCl<sub>4</sub> was investigated on the metallic unit. Tests of the products showed that the ethyl esters, which the authors named "plastiazan-2," are universal plasticizers in the production of nitrocellulose and polyvinyl chloride articles, replacing castor oil and dibutyl phthalate, and are also effective in plasticizing coumarone resins. Orig. art. has: 3 figures and 4 tables.

TITLE: Using indium in neutron film badges

SOURCE: Atomnaya energiya, v. 20, no. 1, 1966, 54-55

TOPIC TAGS: radiation dosimeter, neutron radiation, gamma radiation, indium

ABSTRACT: The authors describe the IFKNG film badge with an indium intensifier shield designed for thermal and intermediate neutrons and  $\gamma$ -radiation. A table is given comparing the theoretical and experimental values for the relative effect of thermal and intermediate neutrons on these badges. It is found that the IFKNG badge may be used with RM-5-4 x-ray film for simple and accurate measurement of thermal neutron doses from 0.005 rem, intermediate neutron doses from 0.03 rem and  $\gamma$ -radiation doses from 0.015 r in mixed fields of neutron and  $\gamma$ -radiation from nuclear reactors. Orig. art. has: 1 figure, 1 table, 1 formula.
